Jake Tracey · 4 months ago

I think you're on the right track except for the bit of technology already exists, it's iCloud.

To pull off actual seamless user switching the Apple TV would need much better hardware + a camera. For now \$100 for a decent Netflix client + AirPlay streaming is a steal, if only it was Jailbroken.

Jesper Bylund Mod → Jake Tracey · 4 months ago Thank you!

I'm not worried about the infrastructure solution, Apple will pull it off, and as you said; probably in the back end. But I am worried about the UI.

There's simply no easy way to manage the number of users that might be involved on a couch.

Jake Tracey → Jesper Bylund · 4 months ago

I've only been using it for a couple of weeks, but I think the Xbox One has this covered from a UX perspective.

The combination of a camera + facial recognition + voice commands works amazingly well.

Come home from work, Say "Xbox on" and it turns on everything and says "Hey Jake" once it recognises my face.

# JavaScript eats the world

### WordPress + BackBone.js

## BackBone.js

## JavaScript framework for RESTful JSON APIs

## Single Page Apps

```
Model
 View
Router
```

## Model + View

## Model: JSON object

# View: functions and representations for the model

# WordPress (JSON API)

# WP API delivers **models** to BackBone.js

## BackBone.js renders templates from Models

# WordPress templates as backwards compatibility?

# LoL! Nothing works without JS.

### So how can we use it?

### Demo Time

### Collection (model)

```
// Post model
var Post = Backbone.Model.extend({
    defaults: {},
    idAttribute: 'ID',
});
```

```
// collection or loop of posts
var Posts = Backbone.Collection.extend({
   model: Post,
   url: 'https://public-api.wordpress.com/rest/v1/sites/jesperbylund.
        com/posts/?number=10&callback=?',
    initialize: function () {
        this.fetch({
            success: this.fetchSuccess,
            error: this.fetchError
        });
        this.deferred = new $.Deferred();
   },
    deferred: Function.constructor.prototype,
    fetchSuccess: function (collection, response) {
        collection.deferred.resolve();
    fetchError: function (collection, response) {
        throw new Error("Fetch did not get collection from API");
    parse: function( response ) {
      return response.posts;
});
```

View

```
// Posts view
var PostsView = Backbone.View.extend({
    el: '#posts',
    events: {
        'click span.read': 'showStory',
    },
    initialize: function(){
        _.bindAll(this, 'createPost', 'showMore');
        this.$el.html('<h3>Loading posts</h3>');
        this.collection = new Posts();
        this.collection.bind('add', this.createPost);
        this.render();
    },
    render: function(){
        _(this.collection.models).each(function(post){ // in case collection
        is not empty
            this.createPost(post);
        }, this);
        return this;
    },
    createPost: function(post){
        var postView = new PostView({
            model: post
       }):
        $('h3',this.$el).hide();
        this.$el.append( postView.render().el );
   },
    showMore: function(){
        console.log('showMore');
```

```
// post view
var PostView = Backbone.View.extend({
   tagName: 'div',
    className: 'post',
    events: {
        'click span.delete': 'unrender',
        'click h2': 'showPost',
    },
    initialize: function(){
        _.bindAll(this, 'remove', 'render', 'unrender', 'showPost');
        this.model.bind('change', this.render);
    },
    render: function(){
        this.$el.html('<div><img class="featured-image" src="'+this.model.get('
            featured_image')+'" />
                        <h2>'+this.model.get('title')+'</h2></div>');
        return this;
    },
    unrender: function(){
        $(this.el).remove();
    },
    showPost: function(){
        $('div.content').removeClass('active');
        if( $('div.content', this.$el).length > 0 ){
            $('div.content', this.$el).addClass('active');
        } else {
            $('div', this.$el).append('<div class="content active">'+this.model
                .get('content')+'</div>' );
        $('html, body').animate({
            scrollTop: $('h2', this.$el).offset().top
        }, 500);
});
```

## But what can we **build** with this?

# Anything WordPress couldn't do

### Questions?

@jesperbylund
